AI Proposal & Pitch Studio

What & Why

Closing new clients is one of the most time-consuming activities for any business. GalaxyBots agents already run task sessions for marketing, operations, sales, and strategy — but there is no dedicated capability for generating polished, client-ready proposals, sales decks, or RFP responses. The AI Proposal & Pitch Studio turns GalaxyBots into a revenue-generating machine for its clients: feed in a prospect's details and a scope of work, and the AI executive team produces a complete, branded proposal in minutes.

This feature directly reduces the time-to-close for GalaxyBots clients and creates a measurable, demonstrable ROI moment every time a proposal is generated.

Done looks like

- A "Proposal Studio" section is accessible from the client workspace and from the Document Studio
- The user provides: prospect name, industry, service being proposed, key pain points, and desired outcome
- The Director of Sales or CMO bot leads a proposal generation session, pulling in relevant context from the client's Knowledge Base and past Task Sessions
- Output is a fully structured proposal document: executive summary, problem statement, proposed solution, scope of work, timeline, investment (pricing), and a call to action — formatted and branded
- Proposals are stored per client with draft/sent/won/lost status tracking
- A "Pitch Deck" mode generates a slide-by-slide outline (compatible with the Document Studio) for presentation format
- A "RFP Response" mode takes an uploaded RFP document (or pasted text) and generates a compliant point-by-point response
- Proposals can be shared via a public token link or downloaded as formatted content
- Win/loss tracking: when a proposal status is updated to Won or Lost, the outcome feeds into the Proof-of-Value ROI dashboard

Out of scope

- Native PDF generation with pixel-perfect design (rich text export is sufficient for now)
- E-signature integration (future add-on)
- CRM auto-sync of proposal outcomes (though HubSpot tool can be used manually)

Tasks

- Proposal schema** — Add a `proposals` table: `clientId`, `prospectName`, `prospectIndustry`, `type` (`proposal/pitch/rfp`), `status` (`draft/sent/won/lost`), `content JSON (sections)`, `createdAt`, `sentAt`. Add a `proposal_sections` structure to allow per-section editing.
- Proposal generation API** — Build `POST /api/proposals/generate` that accepts prospect details and type, then runs an agentic loop with the Sales Director and CMO bots. The loop pulls context from the client's Knowledge Base and recent task session outcomes, then generates each section sequentially with streaming output.
- RFP ingestion** — Add `POST /api/proposals/analyze-rfp` that accepts pasted RFP text or a document reference, extracts key requirements and questions, and maps them to a structured response outline for the generation step.
- Proposal management API** — CRUD: save, update sections, change status (`draft` → `sent` → `won/lost`), list by client, share via public token URL. When status changes to `won/lost`, write an outcome record to `session_outcomes` for ROI tracking.
- Proposal Studio UI** — A new "Proposal Studio" page/tab in the client workspace. Wizard-style: select proposal type → enter prospect details → watch AI generate each section with streaming → review and edit inline → share or download.
- Pitch deck outline mode** — An alternative output format that structures the proposal as a slide-by-slide outline (Slide 1: Title + Hook, Slide 2: The Problem, etc.) with speaker notes for each slide. Compatible with the Document Studio for further formatting.
- Proposal tracker** — A pipeline-style list view showing all proposals per client with status badges (`Draft`, `Sent`, `Won`, `Lost`), prospect name, value (if entered), and days since sent. `Won/lost` rates surface in the Analytics dashboard.
- Shared proposal view** — A clean, public-facing proposal page accessible via a shareable token link. Presents the proposal in a well-formatted, readable layout — the output a prospect would actually receive.
