AI Voice Intelligence — Calls, Transcription & Follow-Up

What & Why

The AI Receptionist (ElevenLabs + Twilio, Task #18) handles inbound calls and lead capture. But the intelligence gathered from those calls — what was said, what the prospect needed, what concerns they raised — currently disappears after the call ends. The AI Voice Intelligence layer captures, transcribes, and analyzes every inbound call, then automatically routes the insights into the GalaxyBots workflow engine: the right bots get briefed, the right pipelines fire, and the client never has to manually follow up on a call again.

Additionally, this expands voice capabilities beyond inbound calls to include AI-generated outbound call scripts, voicemail drop content, and meeting summary generation from uploaded recordings.

Done looks like

- Every inbound receptionist call is transcribed in near-real-time and stored per client
- Immediately after a call ends, a "Call Debrief" is generated by the Sales Director bot: caller name, intent, key concerns, urgency, recommended next action, and a proposed follow-up message
- The call debrief auto-creates a Task Session or pipeline trigger if the caller is a new lead
- Transcripts and debriefs are visible in the Client Detail page under a "Calls" tab
- Admins can upload a meeting recording (MP3/MP4) to any client workspace — the AI transcribes it and produces a structured meeting summary with action items, decisions made, and follow-up tasks
- An "Outbound Script Generator" lets users describe a call objective and get a full call script written by the CMO or Sales Director bot — including opening, discovery questions, objection handling, and close
- A "Voicemail Drop" generator creates a concise, natural-sounding voicemail script for the AI Receptionist or a sales rep to leave
- Call volume, duration, and outcome trends are visible in the Analytics Dashboard

Out of scope

- Outbound auto-dialing or robocall capability (script generation only, not execution)
- Real-time live transcription during active calls (post-call transcription only for now)
- Video call transcription (audio/MP3 only initially)

Tasks

1. **Call transcription pipeline** — After each Twilio/ElevenLabs receptionist call ends, use the OpenAI Whisper API to transcribe the audio. Store transcripts in a `call_transcripts` table (clientId, callId, transcript text, duration, callerInfo, createdAt).
1. **Call debrief generation** — Immediately after transcription, trigger an agentic call with the Sales Director bot: pass the transcript and instruct it to produce a structured debrief (caller intent, concerns, urgency score 1-5, recommended next action, draft follow-up message). Store in a `call_debriefs` table linked to the transcript.
1. **Auto-pipeline trigger from calls** — If the call debrief identifies the caller as a new prospect (not in the client's existing contacts), auto-fire the lead intake pipeline or create a task session for the Sales team bots to begin qualification.
1. **Meeting recording upload & summary** — Add a `POST /api/voice/upload-recording` endpoint accepting an audio file. Transcribe via Whisper, then generate a structured meeting summary (attendees if mentioned, decisions, action items, open questions, next steps) via the Chief of Staff bot. Store and display in the client workspace.
1. **Calls tab in Client Detail** — Add a "Calls" tab to the Client Detail page showing: call list with date, duration, caller info, and debrief summary. Click to expand the full transcript and debrief. Filter by date range and outcome.
1. **Outbound script generator** — A form in the client workspace: enter call objective, target persona, and desired outcome. The CMO or Sales Director bot generates a full call script with opening, discovery questions, objection handling section, and close. Save and download.
1. **Voicemail drop generator** — A sub-feature of the script generator: input context and get a 20–30 second natural voicemail script. Option to have the AI Receptionist voice (ElevenLabs) preview the audio of the voicemail using TTS.
1. **Voice analytics** — In the Analytics Dashboard, add a "Voice" section: call volume over time, average call duration, lead conversion rate from calls, top call intents by frequency, and urgency score distribution.
