BingoLingo.ai — Full Content Intelligence Platform

What & Why

BingoLingo.ai is a standalone AI-powered content platform built to serve GalaxyBots clients and operate as its own product. It is more than a blog writer — it is a full content intelligence suite: AI-generated blog posts, social media content, email newsletters, and SEO-optimized articles, all organized per client by industry vertical. GalaxyBots agents use BingoLingo as a live tool, and BingoLingo operates independently as its own business-facing application.

This replaces the previously cancelled tasks #14 and #15 with a broader, more ambitious scope.

Done looks like

- BingoLingo.ai runs as its own artifact at `/bingolingo` with its own full frontend and API
- Dashboard shows all clients, their industries, and content output history
- Any content type can be generated: blog post, LinkedIn article, Twitter/X thread, email newsletter, press release, or case study — all industry-aware and tone-configurable
- Generated content is stored per client with draft/published/archived status management
- A public-facing "Content Hub" page per client shows their published blog posts at `/bingolingo/hub/:clientSlug`
- A REST API (`/bingolingo/api/`) is fully operational with API key auth so GalaxyBots agents can call it programmatically
- GalaxyBots agents have three registered tools: `bingolingo_create_content` , `bingolingo_publish` , `bingolingo_list_content`
- A BingoLingo integration card lives on the GalaxyBots Integrations page, storing the client's API key
- Content performance tracking: view counts, publish dates, and engagement metrics per post
- A "Content Calendar" view shows what has been published and suggests upcoming topics based on industry trends
- Autonomous weekly content generation: if enabled per client, a scheduled job generates a draft blog post each week using the client's industry and recent context from GalaxyBots task sessions

Out of scope

- Direct social media posting (API authentication with X, LinkedIn, etc. — export/copy only for now)

- Paid subscription billing within BingoLingo itself (billed through GalaxyBots)
- Multi-author workflows and editorial approval chains

Tasks

1. **Scaffold BingoLingo artifact** — Create a new React + Vite artifact at `/bingolingo` with its own API route namespace under `/bingolingo/api`. Add it to the monorepo workspace routing alongside GalaxyBots.
1. **Database schema** — Add `bingolingo_clients`, `bingolingo_content`, and `bingolingo_api_keys` tables to the shared DB. Content table includes: `clientId`, `type` (blog/social/email/press release/case study), `title`, `body`, `status` (draft/published/archived), `topic`, `tone`, `keywords`, `publishedAt`, `viewCount`.
1. **Content generation API** — Build `POST /bingolingo/api/generate` accepting `clientId`, `contentType`, `topic`, `tone`, and optional `keywords`. Call GPT-4o with type-specific system prompts (blog posts get SEO structure, social posts get platform-native formatting, email gets subject line + body). Return structured content with suggested title, slug, and meta description.
1. **Content management API** — CRUD endpoints: save draft, edit, publish, archive, list by client, get by slug. Include a `GET /bingolingo/api/clients/:id/calendar` endpoint returning a content calendar view with publication history and AI-suggested upcoming topics.
1. **API key management** — `POST /bingolingo/api/clients` to register a client and generate an API key. Keys are stored hashed; the raw key is shown once on creation. Authentication via `X-BingoLingo-Key` header on all content endpoints.
1. **Client dashboard UI** — Main BingoLingo dashboard: client list with post counts, industry tags, and last-published date. Add client form with name, industry, and website. Click through to the client's content workspace.
1. **Content generation UI** — Inside each client workspace: a content generator form with type selector (Blog, LinkedIn, Twitter Thread, Email, Press Release, Case Study), topic input, tone selector (Professional, Conversational, Thought Leadership, Educational, Bold/Edgy), keyword list, and a streaming preview of the generated content. Edit inline and publish with one click.
1. **Content calendar UI** — A calendar/timeline view per client showing published posts by date and type. Highlights gaps in the content schedule and shows AI-suggested topics for upcoming weeks based on the client's industry.
1. **Public content hub** — A clean, SEO-structured public page at `/bingolingo/hub/:clientSlug` showing a client's published blog posts — their public-facing content destination. Includes client branding (logo, tagline) pulled from their profile.
1. **GalaxyBots agent tools** — Register `bingolingo_create_content`, `bingolingo_publish`, and `bingolingo_list_content` in the GalaxyBots operational tools registry. Each tool calls the BingoLingo API using the client's stored API key. Add BingoLingo to the GalaxyBots Integrations page credential store.
1. **Autonomous weekly content scheduler** — In the GalaxyBots scheduler service, add a weekly job that, for each client with BingoLingo enabled and auto-content turned on, calls `bingolingo_create_content` with the client's industry and a GPT-generated topic suggestion, saves as draft, and sends an in-platform notification to review.

1. **Content performance tracking** — Track view counts on public hub pages. Expose per-post metrics in the client workspace dashboard (views, publish date, content type breakdown). Include a simple performance summary card on the BingoLingo home dashboard.
