Client Health Intelligence & Retention Engine

What & Why

GalaxyBots manages a growing roster of client companies. Without proactive health monitoring, churn happens silently — a client goes quiet, engagement drops, and by the time it is noticed, they are already deciding to leave. The Client Health Intelligence engine continuously monitors every client's engagement signals, scores their health, predicts churn risk, and automatically triggers retention interventions through the existing pipeline and bot tools. This is the difference between a platform that reacts to churn and one that prevents it — which is the single most impactful lever for long-term revenue growth.

Done looks like

- Every client has a live "Health Score" (0–100) visible on their profile and on the Command Center
- Health score is computed from weighted signals: task sessions run in last 30 days, integrations active, bot interactions, pipeline activity, login frequency, and proposal/ROI engagement
- A health trend line shows whether a client is improving or declining over the past 90 days
- Clients are automatically tagged: Healthy (green), At Risk (yellow), or Critical (red)
- When a client enters "At Risk" status, an automated retention pipeline fires: the Client Success Director bot generates a personalized outreach summary and queues a follow-up action (email draft, Boardroom agenda item, or task session recommendation)
- When a client enters "Critical" status, an alert fires to the platform owner's Command Center immediately
- A "Client Pulse" weekly digest is generated every Monday: a ranked list of clients by health score with one-line status notes and recommended actions from the AI
- Admins can manually override health tags and add notes to a client health log
- Health score history is queryable and visible in the Analytics dashboard

Out of scope

- Predicting revenue churn with financial modeling (requires billing integration data — follow-on)
- NPS survey tooling or direct client satisfaction surveys
- Health scoring for individual users within a client org (account-level only for now)

Tasks

1. **Health score schema** — Add `client_health_scores` table (clientId, score, trend, tag, computedAt) and `client_health_events` (clientId, signal, value, recordedAt). Add a `health_notes` field to the clients table for manual overrides.
1. **Signal collection middleware** — Instrument key platform actions to write health signal events: task session started/completed, pipeline triggered, integration connected, login recorded, proposal sent/won, ROI report viewed. Each event writes a row to `client_health_events` with a signal type and value.
1. **Health score computation service** — A service (run on schedule and on-demand) that reads the last 30/90 days of signal events per client, applies weighted scoring logic, computes a composite 0–100 score, assigns a tag (Healthy ≥ 70 , At Risk 40–69, Critical < 40), and writes the result to `client_health_scores`.
1. **Churn risk pipeline trigger** — Add a scheduled job that runs nightly: for any client whose tag changed to At Risk or Critical, automatically trigger the designated "Client Health" pipeline (or create a task session with the Client Success Director bot) to generate a personalized retention action.
1. **Client health UI** — Add a Health Score card to the Client Detail page showing: current score, tag badge, 90-day trend sparkline, top signals driving the score, and a "Recommended Action" from the AI. Admins can add a manual note and override the tag.
1. **Command Center health overview** — Add a "Client Health" panel to the Command Center showing a ranked list of all clients by health score with status badges and a one-click drill-down. Critical clients are pinned to the top with an alert indicator.
1. **Client Pulse weekly digest** — A Monday morning scheduler job that generates a "Client Pulse" briefing via the Chief of Staff bot: a structured summary of all clients sorted by health risk, with one recommended action per at-risk client. Delivered as an in-platform notification and optional email.
1. **Health analytics** — In the Analytics Dashboard, add a "Client Health" tab showing: overall portfolio health distribution (pie chart), clients by tag over time, average health score trend, and correlation between health score and platform activity metrics.
