Public Developer API Portal & Ecosystem

What & Why

GalaxyBots already has an MCP server, pipeline triggers, and webhook ingestion — but there is no public-facing developer portal where external builders, partners, and clients can discover, authenticate, test, and build on top of the GalaxyBots API. A developer ecosystem is a force multiplier: it turns GalaxyBots into a platform (not just a product), enables partner integrations, and creates a new acquisition channel through developer word-of-mouth.

Done looks like

- A public Developer Portal page at `/developers` with full API reference documentation auto-generated from the OpenAPI spec
- Developers and partners can generate personal API keys from within the portal (scoped to their client account)
- An interactive API playground lets developers test endpoints directly in the browser with live responses
- A Webhooks section shows all available outbound events GalaxyBots can fire (task session completed, pipeline triggered, bot alert raised, lead received) with payload schemas and a test-fire button
- An MCP connection guide explains how to connect Claude, Cursor, or any MCP-compatible AI tool to the GalaxyBots MCP server
- Usage metrics per API key (calls made, tokens consumed, rate limit status) visible in the portal
- A changelog feed shows API version history and breaking change notices
- Partner-tier API keys have elevated rate limits and access to partner-only endpoints (white-label config, client provisioning)

Out of scope

- Public OAuth app marketplace (for third-party apps to request user-delegated access)
- SDKs in multiple languages (documentation first, SDKs are a follow-on)
- Paid developer tiers (covered by billing task)

Tasks

1. **API key management system** — Build a full API key generation, listing, revocation, and scoping system. Keys are associated with a user/client, have configurable scopes (read-only, write, admin), and are stored hashed. Add `GET/POST/DELETE /api/developer/keys` endpoints.

1. **Developer portal UI** — Create a `/developers` page in the GalaxyBots frontend with sections: Overview, Authentication, API Reference, Webhooks, MCP Guide, and My Keys. Style it as a polished developer hub consistent with the platform's aesthetic.
1. **Live API reference** — Render the existing OpenAPI spec (`lib/api-spec/openapi.yaml`) as interactive documentation directly in the portal using a lightweight renderer. Include request/response examples for every endpoint.
1. **Interactive API playground** — Embed a request builder in the portal where authenticated developers can select an endpoint, fill in parameters, and fire a live request against the API — seeing the real response. Pre-populate with their API key.
1. **Webhook event catalog & test tool** — Document all outbound webhook events with full payload schemas. Add a "Send Test Event" button that fires a sample payload to a developer-provided URL so they can build and test integrations without waiting for real events.
1. **MCP connection guide** — A dedicated section explaining how to point Claude Desktop, Cursor, Windsurf, or any MCP client at the GalaxyBots MCP server. Include auto-generated connection config snippets with the user's actual MCP server URL and API key pre-filled.
1. **API usage dashboard** — Per-key usage metrics: total calls, calls by endpoint, token consumption, error rates, and rate limit headroom. Displayed in the developer portal and also surfaced in the Analytics dashboard for admin oversight.
1. **Changelog & versioning** — A developer changelog page listing API changes by date, with breaking vs. non-breaking classifications and migration notes. Updates posted here whenever routes are added or modified.
