Proof-of-Value Engine & Client ROI Dashboard

What & Why

GalaxyBots clients need to see concrete business outcomes from their AI executives — not just activity, but measurable value. Without this, the platform risks being perceived as "impressive demos" rather than a mission-critical business tool, which kills retention, expansion, and enterprise sales cycles.

The Proof-of-Value engine automatically tracks outcomes from every Task Session, quantifies estimated time and cost savings, and surfaces them in a client-facing ROI dashboard. This becomes the #1 retention driver, the key sales artifact for new clients, and the core metric for expansion conversations ("you saved \$X last quarter, unlock \$3X by adding these departments").

Done looks like

- Every completed Task Session records outcome data: tools used, estimated hours saved, integrations triggered, decisions made
- A per-client ROI dashboard shows cumulative metrics: hours saved, estimated cost savings (based on configurable hourly rate), tasks completed, integrations executed, and top-performing bot roles
- Weekly automated "Executive Briefing" reports are generated and optionally emailed to the client — a board-ready summary of what the AI team accomplished, with highlights and recommendations
- A "Value Proof" shareable report can be generated on demand (PDF or public link) showing ROI for a given time period — usable by the client in internal budget reviews or by partners in sales demos
- Outcome data is stored per session and queryable by date range, department, and bot role

Out of scope

- Real-time financial system integration (e.g., pulling actual revenue data from accounting software) — estimates based on configurable inputs are sufficient for now
- Advanced ML-based attribution modeling
- Public benchmarking against other clients

Tasks

1. **Outcome tracking schema** — Add a `session_outcomes` table to the DB that records per-task-session: bots deployed, tools executed (count by type), duration, estimated hours saved (configurable multiplier per tool type), and a free-text outcome summary generated by the lead bot at session close.

1. **Session outcome capture** — At the end of each Task Session (when the agentic loop completes), trigger a lightweight summarization call that asks the lead bot to write a 2-3 sentence business outcome summary and records it alongside the tool execution counts in `session_outcomes`.
1. **ROI calculation service** — Build a service that aggregates `session_outcomes` by client and computes: total hours saved, estimated dollar value saved (hours × client's configured hourly rate, default \$150/hr), total sessions run, breakdown by department/bot role, and top tools used.
1. **ROI dashboard UI** — Add a "Value Report" or "ROI" section to the GalaxyBots frontend showing the client's cumulative metrics with charts (sessions over time, savings by department, most-used bots). Should feel like a board-level executive dashboard — clean, impressive, and data-driven.
1. **Weekly Executive Briefing** — Using the existing scheduler, generate a weekly summary email (or in-app notification) per client that highlights what the AI team accomplished that week, top outcomes, and a recommended next action. The briefing is generated by a designated "Chief of Staff" bot using the outcome data.
1. **Shareable ROI report** — Allow the client or admin to generate a shareable Proof-of-Value report (viewable via a public token URL or exportable) covering a selected date range. The report shows headline savings figures, session highlights, and a "what's next" recommendation — designed to be used in internal budget reviews or by partners in prospect demos.
